Intermolecular Energies

Supermolecular approach

$$E_{int} = E_{AB} - E_A - E_B$$

- ► Straightforward, but cannot separate different types of interactions
- ► Can adopt to different electronic structure methods
- ► DFT-D3 with proper functional can be both cheap and accurate
- Symmetry-Adapted Perturbation Theory
 - ► Can give details about different types of interactions; important in understanding their nature
 - ▶ Not as cheap as DFT-D3
 - SAPT0 is somewhat cheap, but does not include intramonomer correlation

Yi Xie | April 14, 2022 3/3

SAPT(DFT)

- Attempt to inlude intramonomer correlation in a cheap way
- Replaces HF orbitals with KS orbitals
- Needs to consider orbital response for dispersion terms
- Exchange-dispersion term needs to be estimated from scaling
- Investigate the accuracy and efficiency of SAPT(DFT)

Yi Xie | April 14, 2022 4/31

Three-Body Interaction

- Crucial in computing lattice energies
- DFT-D3 does not perform well for three-body interaction
- ▶ MP2.5 scales as $O(N^6)$, MP2 is $O(N^5)$ but lacks three-body dispersion
- Three-body dispersion can be implemented with SAPT(DFT) in ${\cal O}(N^5)$
- Combine MP2 with SAPT(DFT) dispersion to model three-body interaction

Yi Xie | April 14, 2022 5/3

Idea of SAPT(DFT)

SAPT energy in orders of interaction and fluctuation potentials; n denotes order in V and k, l for W_A, W_B

$$H = F_A + F_B + V + W_A + W_B$$

$$E_{int} = \sum_{n=1}^{\infty} \sum_{k=0}^{\infty} \sum_{l=0}^{\infty} \left(E_{pol}^{(nkl)} + E_{exch}^{(nkl)} \right)$$

- SAPT0: n = 2, k = l = 0, no intramonomer correlation, $O(N^5)$ cost
- ▶ Many-body SAPT: $k, l \ge 2, O(N^7)$ or higher cost
- SAPT(DFT): Use Kohn-Sham operator $K_{A,B}$ instead of Fock operator $F_{A,B},\,O(N^5)$ cost
- Primitive SAPT(DFT) works well on 1st-order terms, but not 2nd-order terms (especially dispersion). Needs orbital response for them

Yi Xie | April 14, 2022 8/31

Dispersion Term

- ALDA kernel good for pure GGA functional, but not for hybrid functional
- ▶ Exact exchange in v_{xc} → increased ϵ^{ab}_{ij} → decreased $E^{(2)}_{disp}$

$$E_{disp,u}^{(2)} = -4 \sum_{ia \in A, jb \in B} \frac{\left| (ia|jb) \right|^2}{\epsilon_{ij}^{ab}}$$

▶ Hybrid ALDA kernel to compensate, or localized HF (LHF) exchange to avoid increase in ϵ^{ab}_{ij}

$$f_{xc} = \alpha f_{xc}^{HF} + (1 - \alpha) f_{xc}^{ALDA}$$

Yi Xie | April 14, 2022 9/31

Equation for $E_{disp}^{(2)}$

Computing coupled FDDS:

$$\chi = \chi'_0 + (\chi'_0 \mathbf{S}^{-1} \mathbf{W} + \mathbf{K}) \left[\mathbf{S} - (\chi'_0 \mathbf{S}^{-1} \mathbf{W} + \mathbf{K}) \right]^{-1} \chi'_0$$
$$\chi'_0 = \chi_0 - \alpha \mathbf{K}_2 (\lambda)$$
$$\mathbf{K} = \left[-\alpha \mathbf{K}_1 (\lambda d) - \alpha \mathbf{K}_2 (\lambda d) + \alpha^2 \mathbf{K}_{21} (\lambda) \right] (\mathbf{R}^t)^{-1} \mathbf{S}$$

- $lackbox{O}(N^5)$ scaling is limited to forming ${f K}_1$, ${f K}_2$ and ${f K}_{21}$
- Separates nontrivial and trivial parts of the code, also highly reduces need of disk I/O operations
- $\triangleright E_{disp}^{(2)}$ from coupled FDDS:

$$\begin{split} E_{disp}^{(2)} & = -\frac{1}{2\pi} \int_{0}^{\infty} d\omega \int d\mathbf{r}_{A} d\mathbf{r}_{A}' d\mathbf{r}_{B} d\mathbf{r}_{B}' \\ & \frac{1}{|\mathbf{r}_{A} - \mathbf{r}_{B}|} \frac{1}{|\mathbf{r}_{A}' - \mathbf{r}_{B}'|} \chi^{A} \left(\mathbf{r}_{A}, \mathbf{r}_{A}' | i\omega\right) \chi^{B} \left(\mathbf{r}_{B}, \mathbf{r}_{B}' | i\omega\right) \end{split}$$

Exchange-Dispersion Term

- Coupled exchange-dispersion requires storing 4-index tensors on disk
- Estimate from scaling uncoupled exchange-dispersion; Scale with ratio in dispersion term or with pre-fitted (with S22×5) fixed factor

$$\tilde{E}_{exch-disp,r}^{(2)} = E_{exch-disp,u}^{(2)} \cdot \frac{E_{disp,r}^{(2)}}{E_{disp,u}^{(2)}}$$

$$\tilde{E}_{exch-disp,r}^{(2)} = \alpha \cdot E_{exch-disp,u}^{(2)}(\alpha = 0.686361)$$

- lacktriangle The value above is fitted from $E^{(2)}_{exch-disp,u}$ with LHF orbitals
- Non-LHF orbitals have greater o-v gaps and smaller $E_{disp,u}^{(2)}$, needs to re-fit with non-LHF results

Yi Xie | April 14, 2022 11/3

LHF vs non-LHF orbitals

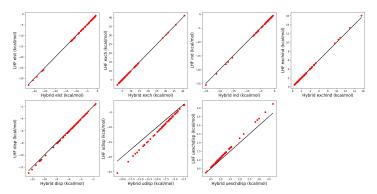

Figure: Hybrid vs. LHF values for each term for S66 data set $(E_{elst}^{(1)}, E_{exch}^{(1)}, E_{ind}^{(2)}, E_{exch-ind}^{(2)}, E_{disp.v}^{(2)}, E_{exch-disp.v}^{(2)})$

Yi Xie | April 14, 2022 12/31

GRAC

- ► (Hybrid-)GGA functionals does not have correct long-range behavior $v_{xc}(r) \rightarrow -1/r + (I_p + \epsilon_{\text{HOMO}})$
- Underestimates o-v gap as a consequence
- Functionals like LB94 have correct asymptotic behavior, but poor in bulk region
- ▶ Using gradient-regulated asymptotic correction (GRAC) scheme to connect PBE0 and LB94 with the switching function f[g(r)]:

$$\begin{split} v_{xc}^{\text{GRAC}} &= \{1 - f[g(\boldsymbol{r})]\} \, v_{xc}^{\text{PBE0}} + f[g(\boldsymbol{r})] v_{xc}^{\text{LB94}} \\ &f[g(\boldsymbol{r})] = \left(1 + e^{-\alpha[g(\boldsymbol{r}) - \beta]}\right)^{-1} \\ &g(\boldsymbol{r}) = \frac{|\nabla \rho(\boldsymbol{r})|}{\rho^{4/3}(\boldsymbol{r})} \end{split}$$

GRAC & Long-Range Behavior

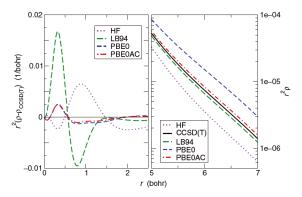

Figure: Radial densities $r^2\rho(r)$ of Ne atom (right) and errors compared to CCSD(T) density (left) for various xc potentials.¹

- 3 Three-Body FDDS Dispersion Background

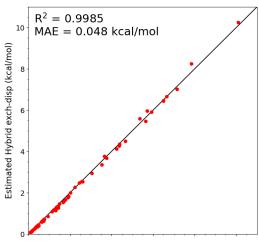

Exchange-Dispersion Refitting

- Need to fit the uncoupled $E^{(2)}_{exch-disp,r}$ with non-LHF orbitals on the coupled LHF orbital values (implemented in Molpro)
- Assuming coupled LHF and non-LHF orbital $E^{(2)}_{exch-disp,r}$ from the behavior of $E^{(2)}_{disp,r}$
- Exchange-related components depend heavily on distance between monomers, sets like S22×5 and S66×8 would be preferred
- ▶ Determine the scaling factor with S22×5, validate with S66×8

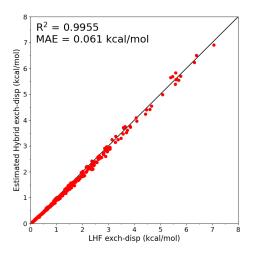

S22×5 Fitting Results

Yi Xie | April 14, 2022 17/3

S66×8 Validating Results

Yi Xie | April 14, 2022 18/31

Termwise results

- Compared the SAPT(DFT)/aug-cc-pVTZ results of our code to SAPT(CCSD)/aug-cc-pVTZ results from Korona S2², which consists of 14 small dimers
- Also comparing the results for S66. SAPT(CCSD) results are not available, used SAPT2+3(CCD)δMP2/aug-cc-pVTZ as reference.
 Also added SAPT0/aug-cc-pVDZ, SAPT2+/aug-cc-pVDZ and SAPT2+(3)δMP2/aug-cc-pVTZ into comparison as side-reference.
- Errors of each system with respect to reference shown as vertical lines
- Mean absolute error (MAE) and mean unsigned relative error (MURE) listed for S2
- Color scheme for S66 systems: Hydrogen-bonded (HB, red), mixed-influence (MX, green), dispersion-dominated (DD, blue)

²T. Korona, Mol. Phys. **111**, 3705 (2013).

Comparison with LHF Approach

TABLE IV. Wall times (in hours) for SAPT(DFT) computations of RDX dimer/aug-cc-pVTZ with hybrid and LHF algorithm.

Subroutine	\mathbf{Hybrid}	LHF
Delta HF	0.96	N/A^a
DFT	0.45	2.29
xc kernel	0.08	4.17
FDDS object ^b	2.35	N/A
Disp time integration	0.37	3.59
Exch-disp	0.41	1.99
Total	5.03	12.80

a The δHF correction, recommended for SAPT(DFT) computations of polar molecules, is performed by default in Pst4 but not in Molpro.

Yi Xie | April 14, 2022 27/31

b Including integral transformation, form X/form Y (the O(N⁵) part) and QR factorization. In Molpro, the integral transformation is integrated with other terms, and the other steps are not relevant for LHF.

C₆₀–Buckycatcher Complex

- $ightharpoonup N_{bf} = 3012, N_{aux} = 9284$ with aug-cc-pVDZ basis set
- Using Intel i9-10980XE processor with 18 cores, completed entire calculation in 4.03 days
- ▶ 42.7 hours for $E_{disp}^{(2)}$; 20.1 hours for the $O(N^5)$ subroutines
- ▶ Cost of DFT and $E_{ind}^{(2)}$ still somewhat significant
